

Please amend Claims 1, 18, 34-37 and 41 as follows. A marked-up copy of the amended claims showing the changes made thereto, is attached. Note that all the claims currently pending in this application, including those not presently being amended, have been reproduced below for the Examiner's convenience.

c1 sub 01 1. (Three Times Amended) An image display system capable of performing stereoscopic display, comprising:

stereoscopic image display means for displaying a stereoscopic image having stripe parallax images arranged for right and left eyes on a display screen;

window setting means for setting a window on a desired position of the display screen of said stereoscopic display means, in which a stereoscopic image is displayed;

stereoscopic vision control means for controlling directivity of the stereoscopic image displayed on said stereoscopic image display means such that stripe images of the stereoscopic image are respectively observed with the right and left eyes; and

changing means for, when a relative positional relationship between the stereoscopic image displayed in said window set by said setting means and said stereoscopic vision control means is not a proper positional relationship with which an observer can obtain a proper stereoscopic vision, changing the display state of said window so as to realize the proper positional relationship between said stereoscopic image and said stereoscopic vision control means.

3. (Unamended) The system according to claim 1, wherein said changing means shifts the window by a distance corresponding to a stripe pitch of the stripe image in a direction of stripe width of the stripe image.

4. (Unamended) The system according to claim 3, wherein an amount of shift of the window is equal to a minimum pixel pitch of said stereoscopic image display means.

5. (Unamended) The system according to claim 3, wherein the stripe image is comprised of a horizontal stripe image in the screen, and a direction in which the window is shifted is a vertical direction in the screen.

6. (Unamended) The system according to claim 3, wherein the striped image is comprised of vertical stripe images in the screen, and a direction in which the window is shifted is a horizontal direction in the screen.

7. (Unamended) The system according to claim 1, wherein said changing means shifts the stereoscopic image in the window by a distance corresponding to a length of a short side of each of the stripe images constituting the stereoscopic image in a direction parallel to a short side of the stripe image.

8. (Unamended) The system according to claim 7, wherein an amount of shift of the stereoscopic image in the window is equal to a minimum pixel pitch of said stereoscopic image display means.

9. (Unamended) The system according to claim 7, wherein the stripe image is constituted by a horizontal stripe image in the screen, and a direction in which the stereoscopic image in the window is shifted is a vertical direction in the screen.

10. (Unamended) The system according to claim 7, wherein the striped image is constituted by vertical stripe images in the screen, and a direction in which the stereoscopic image in the window is shifted is a horizontal direction in the screen.

11. (Unamended) The system according to claim 1, wherein said changing means interchanges odd and even stripe images constituting the stereoscopic image displayed in the window.

15. (Unamended) The system according to claim 1, wherein said changing means is executed after the window is opened and a stereoscopic image is displayed therein or the window is moved.

16. (Unamended) The system according to claim 1, wherein said changing means is executed at respective positions between movements of the window while the window is moved.

17. (Unamended) The system according to claim 16, wherein an execution period of said changing means is shortened while the window is moved.

C1 Sub D4 18. (Three Times Amended) An information processing apparatus which can be connected to an image display apparatus having stereoscopic vision control means for controlling directivity of a stereoscopic image to allow an observer to observe stripe images of the stereoscopic image with right and left eyes, respectively, comprising:

generation means for generating image data including a window to be located on a desired position of a display screen of said image display apparatus, in which stripe parallax images corresponding to the right and left eyes are arranged so as to display a stereoscopic image;

C2 determination means for determining whether a relative positional relationship between the stereoscopic image displayed in the window generated by said generating means and said stereoscopic vision control means of said image display apparatus is a proper positional relationship which allows a proper stereoscopic vision; and

adjustment means for, when said window is displayed on the screen and when said determination means determines that the positional relationship is not proper , adjusting the relative positional relationship to allow a proper stereoscopic vision by changing the display state of said window.

19. (Unamended) The apparatus according to claim 18, wherein said adjustment means shifts the window by a distance corresponding to a length of a short side of the stripe image in a direction parallel to a short side of the stripe image.

20. (Unamended) The apparatus according to claim 19, wherein an amount of shift of the window is equal to a minimum pixel pitch of said image display apparatus connected to said information processing apparatus.

21. (Unamended) The apparatus according to claim 19, wherein the stripe image is comprised of a horizontal stripe image in the screen, and a direction in which the window is shifted is a vertical direction in the screen.

22. (Unamended) The apparatus according to claim 19, wherein the striped image is comprised of vertical stripe images in the screen, and a direction in which the window is shifted is a horizontal direction in the screen.

23. (Unamended) The apparatus according to claim 18, wherein said adjustment means shifts the stereoscopic image in the window by a distance corresponding to length of a short side of each of the stripe images constituting the stereoscopic image in a direction parallel to a short side of the stripe image.

24. (Unamended) The apparatus according to claim 23, wherein an amount of shift of the stereoscopic image in the window is equal to a minimum pixel pitch of said image display apparatus.

25. (Unamended) The apparatus according to claim 23, wherein the stripe image is comprised of a horizontal stripe image in the screen, and a direction in which the stereoscopic image in the window is shifted is a vertical direction in the screen.

26. (Unamended) The apparatus according to claim 23, wherein the striped image is comprised of vertical stripe images in the screen, and a direction in which the stereoscopic image in the window is shifted is a horizontal direction in the screen.

27. (Unamended) The apparatus according to claim 18, wherein said adjustment means interchanges odd and even stripe images comprising the stereoscopic image displayed in the window.

31. (Unamended) The apparatus according to claim 18, further comprising detection means for detecting that a window in which a stereoscopic image is to be displayed is opened or moved, and

wherein said adjustment means is executed when said detection means detects that the window is opened or moved.

32. (Unamended) The apparatus according to claim 18, further comprising detection means for detecting movement of a window in which a stereoscopic image is displayed, and

wherein said adjustment means is executed at respective positions between movements of the window while the window is moved.

33. (Unamended) The apparatus according to claim 32, wherein an execution period of said adjustment means is shortened while the window is moved.

sub D8

34. (Three Times Amended) A method of controlling an information display system having stereoscopic image display means for displaying a stereoscopic image obtained by arranging stripe parallax images corresponding to the right and left eyes of an observer on a display screen and stereoscopic vision control means for controlling directivity of the stereoscopic image to allow the observer to observe stripe images of the stereoscopic image with right and left eyes, respectively, comprising:

setting a window on a desired position of the display screen of a stereoscopic image display, in which a stereoscopic image is displayed;

detecting a relative positional relationship between the stereoscopic image displayed in the window and the stereoscopic vision control means; and

when the relative positional relationship detected is not a proper positional relationship which allows a proper stereoscopic vision, changing the display state of the window to allow the proper positional relationship between the stereoscopic image and the stereoscopic vision control means.

35. (Three Times Amended) A method of controlling an information

processing apparatus which can be connected to an image display apparatus having stereoscopic vision control means for controlling directivity of a stereoscopic image obtained by arranging stripe parallax images corresponding to right and left eyes of an observer to allow the observer to observe stripe images of the stereoscopic image with right and left eyes, respectively, comprising:

generating image data including a window to be located on a desired position of a display screen of the image display apparatus, in which stripe parallax images

corresponding to the right and left eyes are arranged to display a stereoscopic image;

determining whether a relative positional relationship between the generated stereoscopic image displayed in the window and the stereoscopic vision control means of the image display apparatus is a proper positional relationship which allows a proper stereoscopic vision; and

when the window is displayed on the screen and it is determined that the positional relationship is not proper, adjusting the relative positional relationship to allow a proper stereoscopic vision by changing the display state of the window.

---

36. (Three Times Amended) A storage medium storing a computer

program for performing image display by using an image display apparatus having stereoscopic vision control means for controlling directivity of a stereoscopic image obtained by arranging stripe parallax images corresponding to right and left eyes of an observer to allow the observer to observe stripe images of the stereoscopic image with right and left eyes, respectively, said computer program comprising:

a code for generating image data including a window to be located on a desired position of a display screen of the image display apparatus, in which stripe parallax images corresponding to the right and left eyes are arranged to display a stereoscopic image;

a code for determining whether a relative positional relationship between the generated stereoscopic image displayed in the window and the stereoscopic vision control means of the image display apparatus is a proper positional relationship which allows a proper stereoscopic vision; and

C5

a code for adjusting, when the window is displayed on the screen and it is determined that the positional relationship is not proper, the relative positional relationship to allow a proper stereoscopic vision by changing the display state of the window.

37. (Twice Amended) An image display system capable of performing

stereoscopic display, comprising:

C6

stereoscopic image display means for displaying a stereoscopic image having stripe parallax images arranged for right and left eyes;

stereoscopic vision control means for controlling directivity of the stereoscopic image displayed on said stereoscopic image display means such that stripe images of the stereoscopic image are respectively observed with the right and left eyes;

instruction means for instructing to display a new stereoscopic image on a desired position of said stereoscopic image display means; and

display control means for displaying the new stereoscopic image on said stereoscopic image display means so that an observer can obtain a proper stereoscopic vision of the new stereoscopic image, with said display control means comprising:

determination means for determining whether a relative positional relationship between the stereoscopic image displayed in a window generated by generating means and said stereoscopic vision control means is a proper positional relationship which allows a proper stereoscopic vision; and

adjustment means for, when said window is displayed on the screen and it is determined that the positional relationship is not proper, adjusting the relative positional relationship to allow a proper stereoscopic vision by changing the display state of said window.

38. (Unamended) The system according to claim 37, wherein said display control means displays the new stereoscopic image in a window opened in said stereoscopic display means.

39. (Unamended) The system according to claim 38, wherein said display control means adjusts the display position of the new stereoscopic image in the window by one stripe pitch of the stripe parallax images.

40. (Unamended) The system according to claim 38, wherein said display control means is executed after the window is opened and the new stereoscopic image displayed therein and/or after the window is moved.

C7 sub D9 41. (Twice Amended) A method of controlling an image display system having stereoscopic image display means for displaying a stereoscopic image having stripe parallax images arranged for right and left eyes and stereoscopic vision control means for controlling directivity of the stereoscopic image displayed on said stereoscopic image display means such that stripe images of the stereoscopic image are respectively observed with the right and left eyes, said method comprising the steps of:

instructing to display a new stereoscopic image on a desired position of the stereoscopic image display means; and

displaying the new stereoscopic image on the stereoscopic image display means so that an observer can obtain a proper stereoscopic vision of the new stereoscopic image, with the display step including the substeps of:
